For more than 30 years, Western University — including Robarts Research Institute — and its affiliated hospitals have driven Canadian leadership in biomedical imaging research and development, establishing one of the world’s top imaging complements in the process. This expertise is based on a strategic effort to connect groups, institutions and platforms across disciplines to advance training, basic science, pre-clinical, clinical and commercialization activities in the field. Specific strengths in functional neuroimaging, musculoskeletal health and image-guided surgery provide important discoveries that help us understand human function and disease. With more than 400 personnel actively engaged in imaging research, and world-class infrastructure that includes the country’s highest-field human MRI system, Western and its partners continue to improve Canadian competitiveness globally and shape the future of health care at home.
